24 M	16	2003
96 M	64	2006
384 M	256	2009

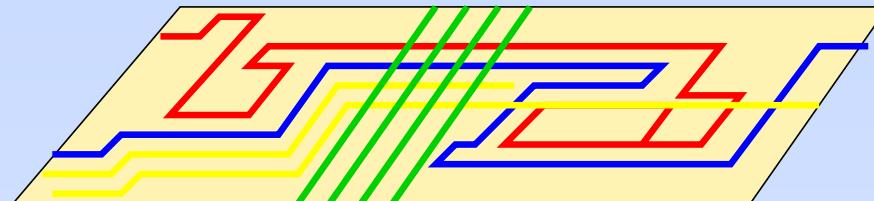

# Functions, Architecture, and Physics

Concurrent  
processes

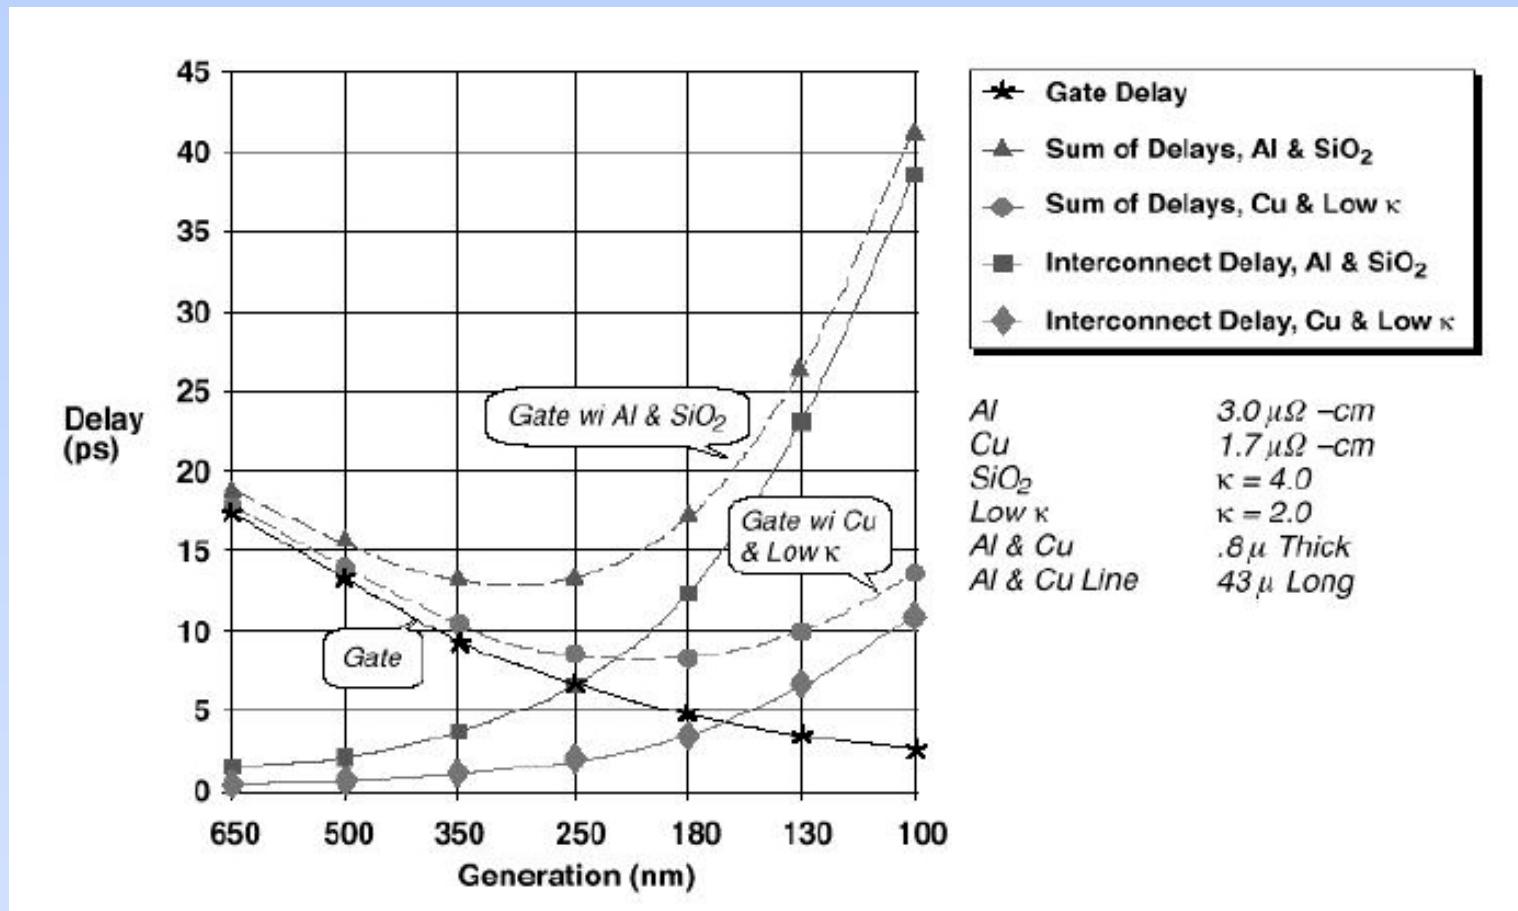

Large number  
of resources

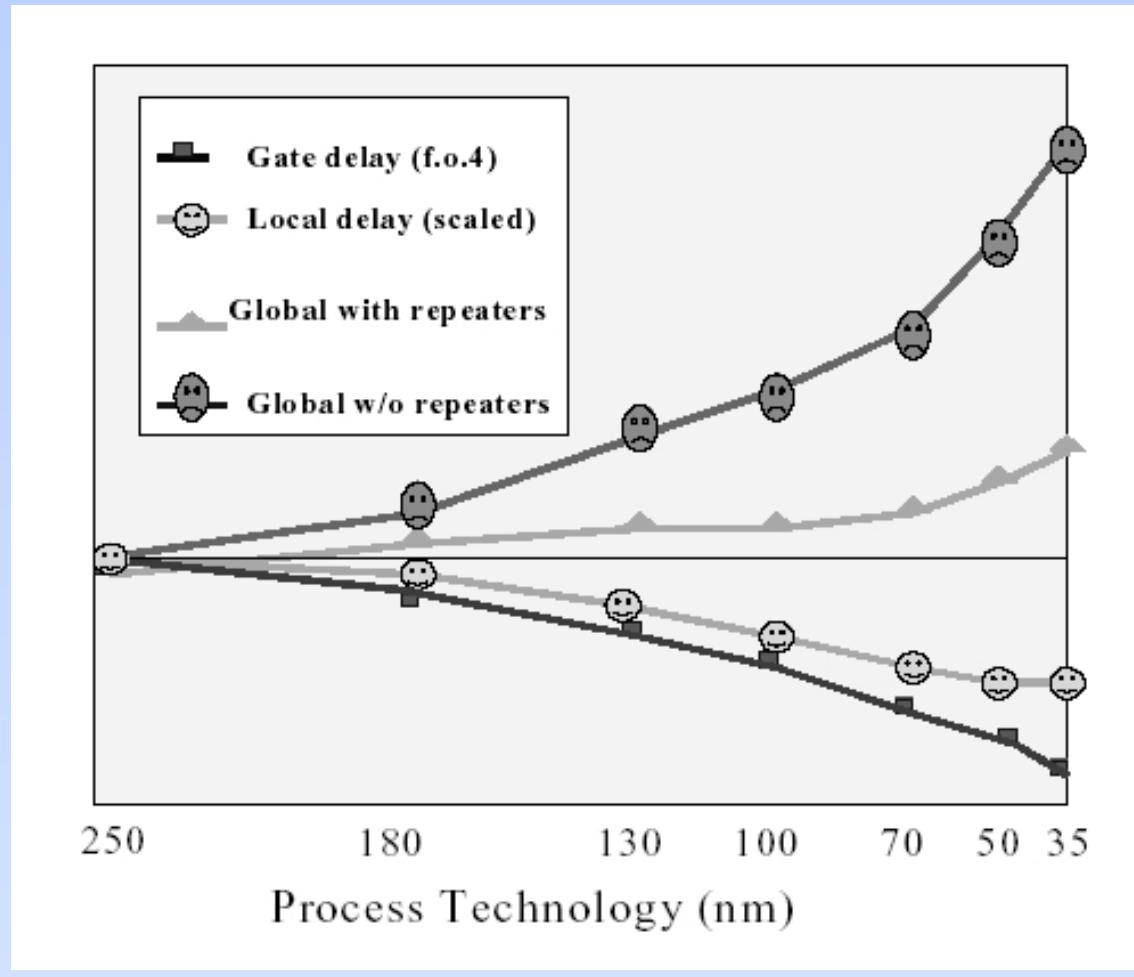

Physical  
issues

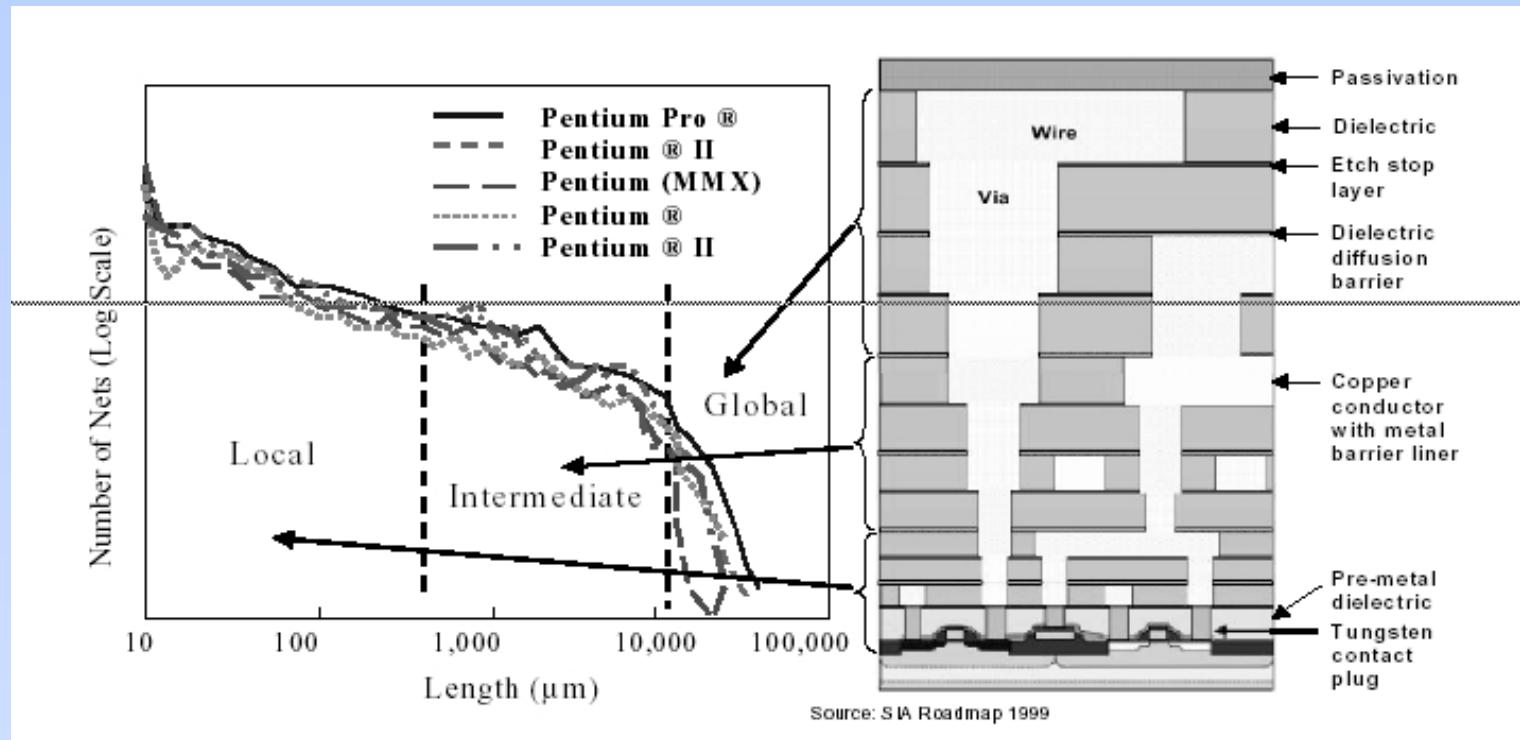

# Gate vs. Line Delay

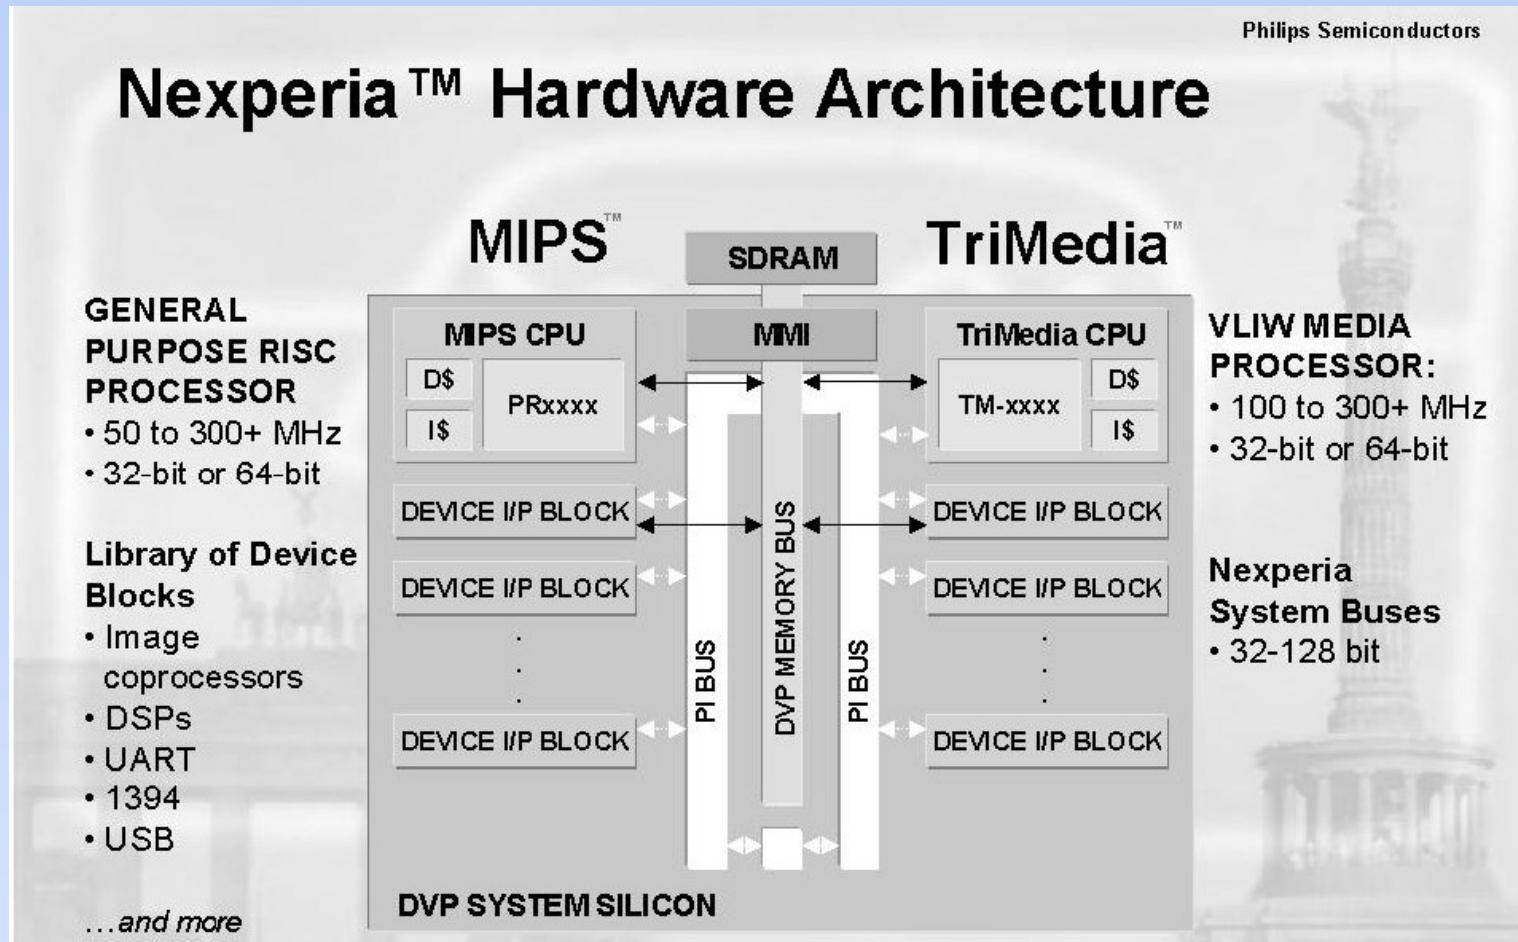

# Local and Global Wire Delay

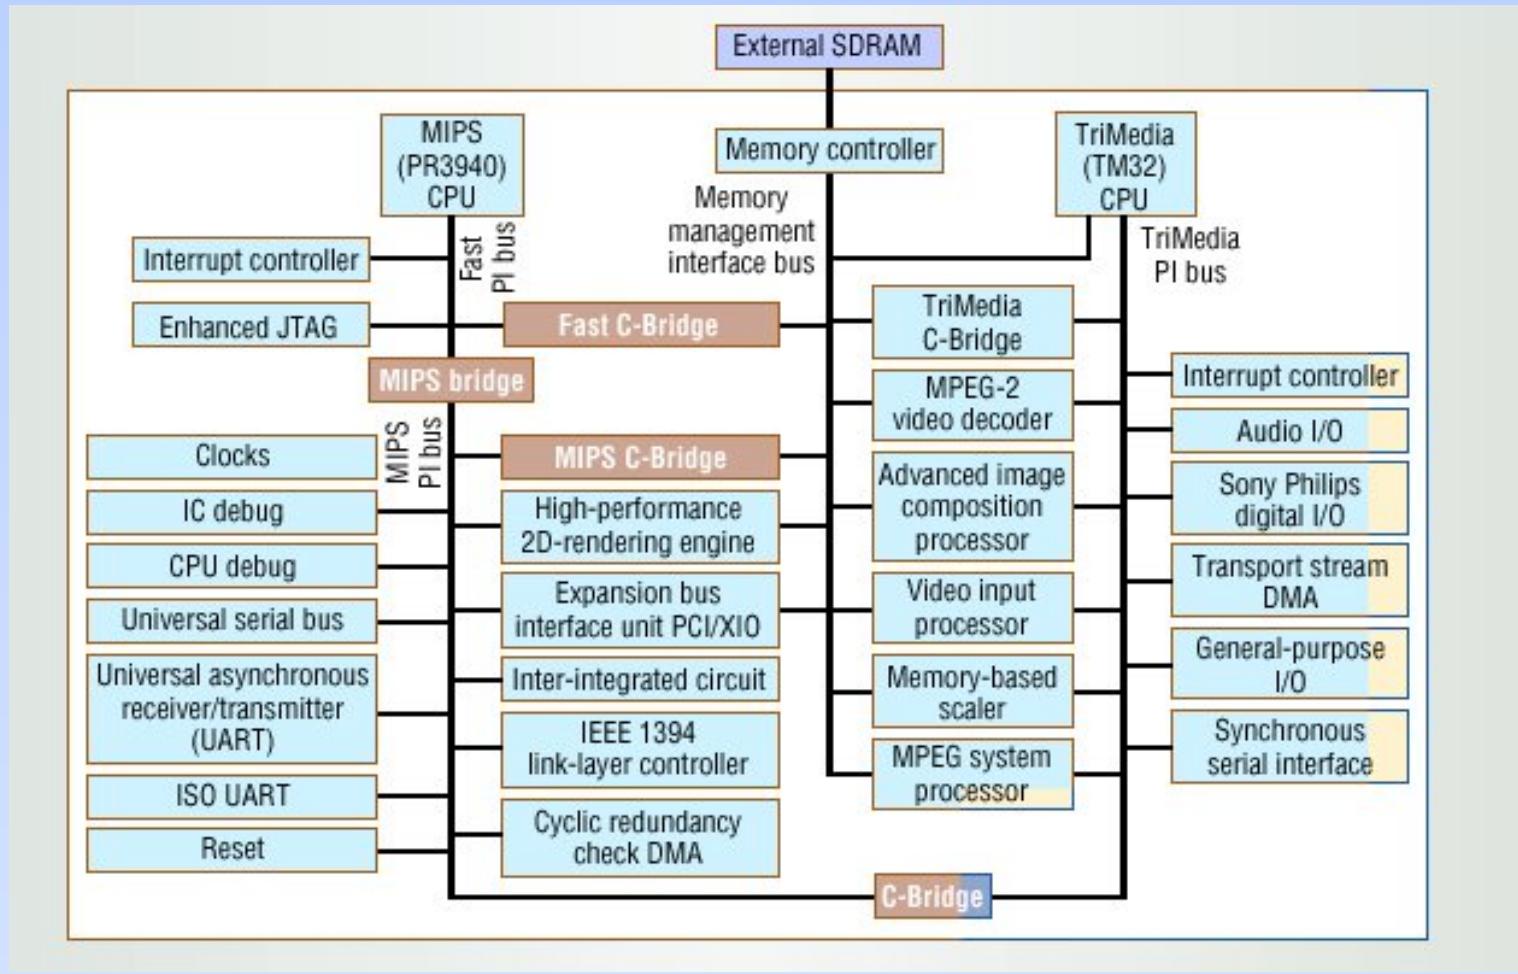

# Wires in a Pentium Processor

# Nexperia Platform

# TriMedia Processor

# Motivation

- A systematic approach to on-chip communication is a necessity;
- General platform for a variety of applications;
- Flexibility by means of selection of resources and communication services;
- Reuse of design and verification of communication services, architecture and implementation;
- Reuse of resources and features (system functionality + resource implementation);
- Better controllable physical properties;

# Overview

Introduction

## Topology and Structure

Protocol Stack

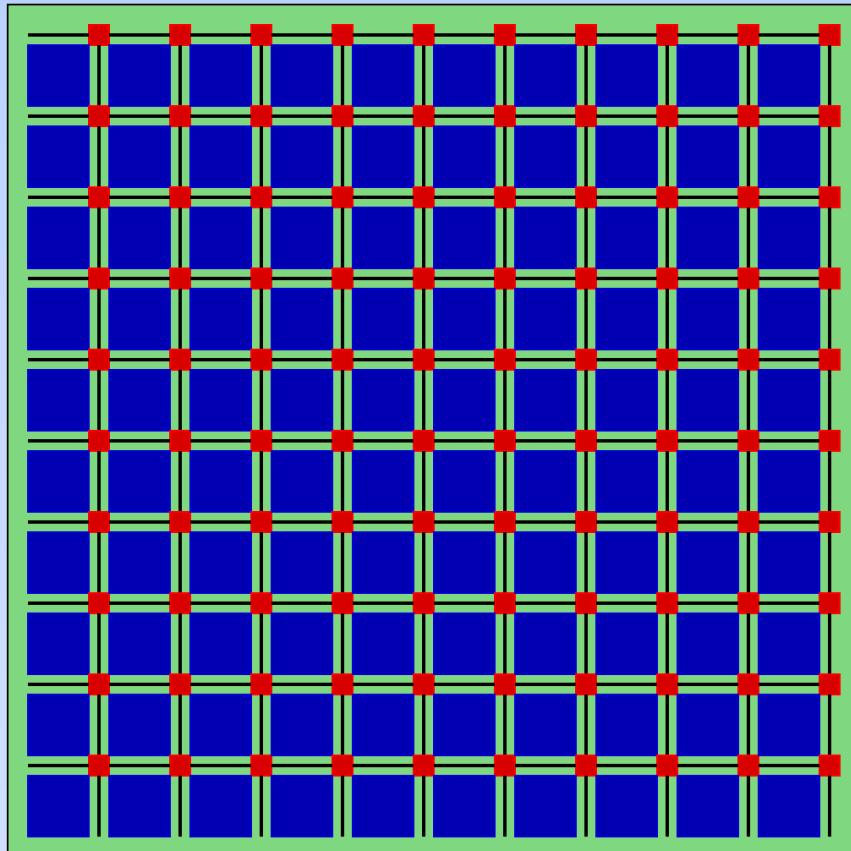

The Network Layer and the Switch

Data Protection

Clocking

# Nostrum Topology: Mesh

## Characteristics:

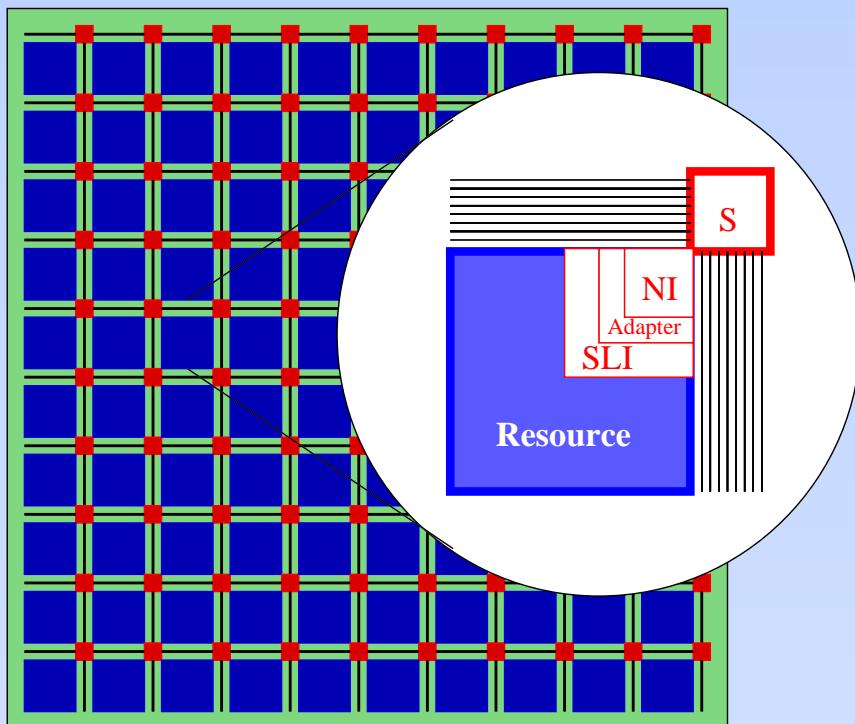

- Resource-to-switch ratio: 1
- A switch is connected to 4 switches and 1 resource
- A resource is connected to 1 switch
- Max number of hops grows with  $2n$

## Motivation:

- Regularity of layout; predictable electrical properties
- Expected locality of traffic

# The Node in a Mesh

NI: Network Interface:

- Compulsory
- HW
- Implements the network layer protocol

Adapter: Resource specific interface circuit;

SLI: Session Layer Interface:

- Optional
- Hardware and/or software
- Implements the session layer protocol

# Overview

Introduction

Topology and Structure

## Protocol Stack

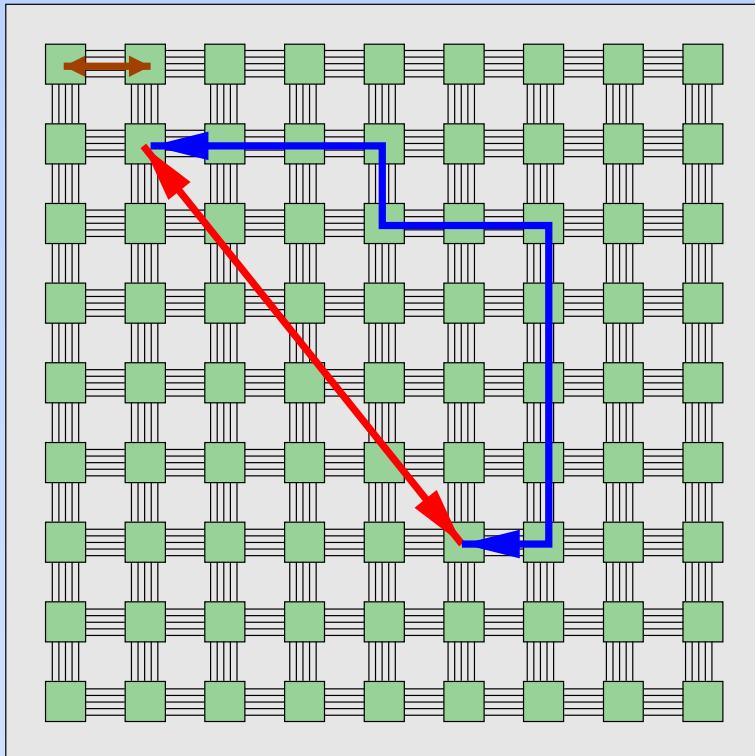

The Network Layer and the Switch

Data Protection

Clocking

# Communication is Key

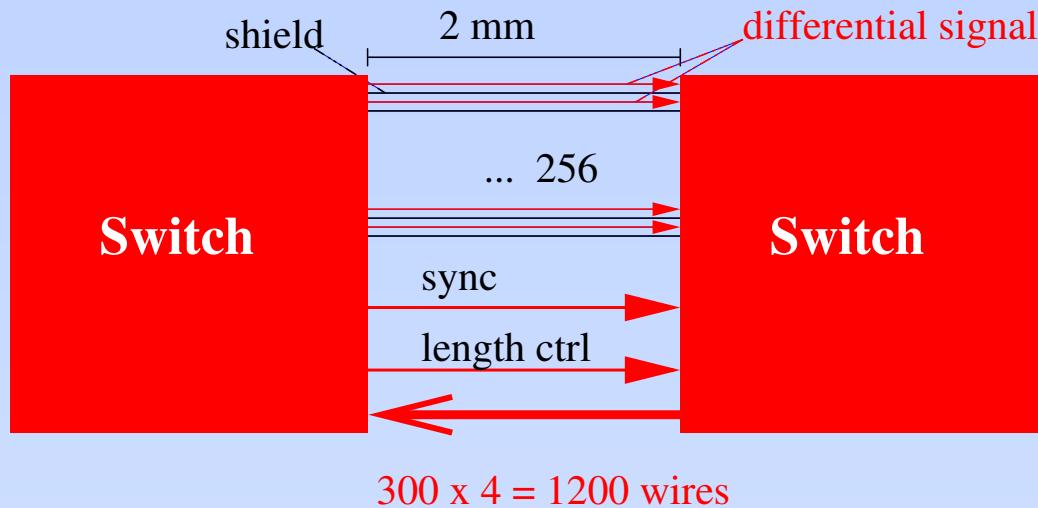

## Communication Layers:

- Physical layer: switch-to-switch and switch-to-resource
- Data link layer: switch-to-switch and switch-to-resource
- Network layer: resource-to-resource
- Session layer: process-to-process
- Application layer: application-to-application

# Physical Layer

Parameters:

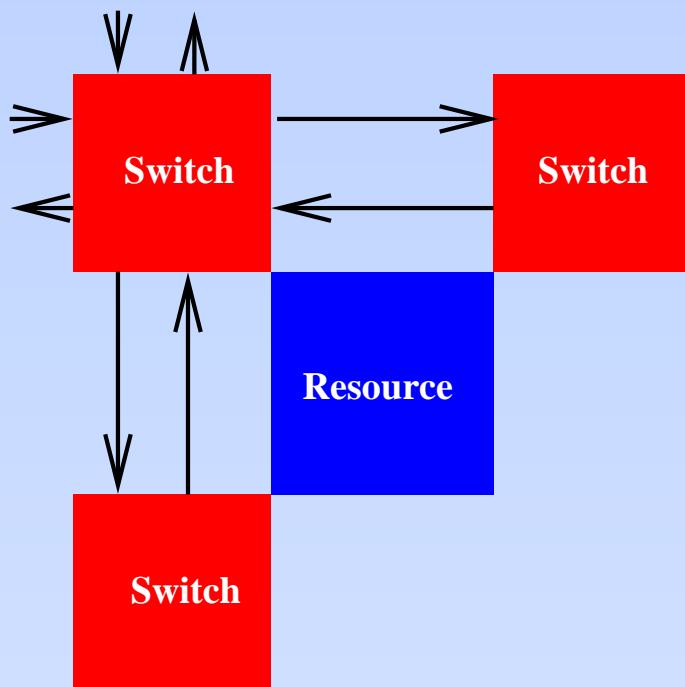

- Physical distance
- Number of lines
- Activity control
- Buffers and pipelining

Nostrum status:

- Channel dimension:  
 $2mm \times 100\mu m$
- 128 data lines in each direction on 4 metal layers
- No pipelining
- On/off control for power saving

# Data Link Layer

Parameters:

- Line frequency versus switch frequency
- Buffering
- Error correction
- Power optimization encoding

Nostrum status:

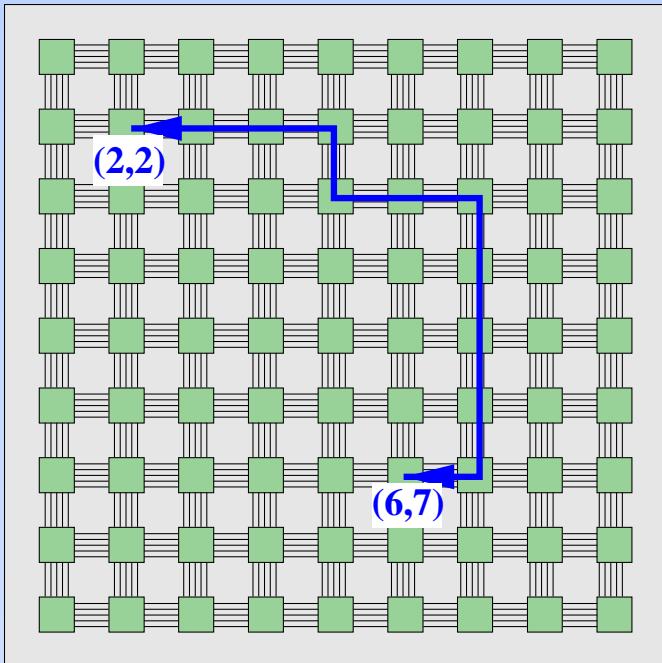

- Physical packet = data link packet
- Physical clock = data link clock
- Single packet input buffer
- Error correction
- On/off activity control

# Network Layer

Parameters:

- Link layer cell size vs. network layer packet size
- Network address scheme
- Routing algorithm
- Priority classes
- Error correction

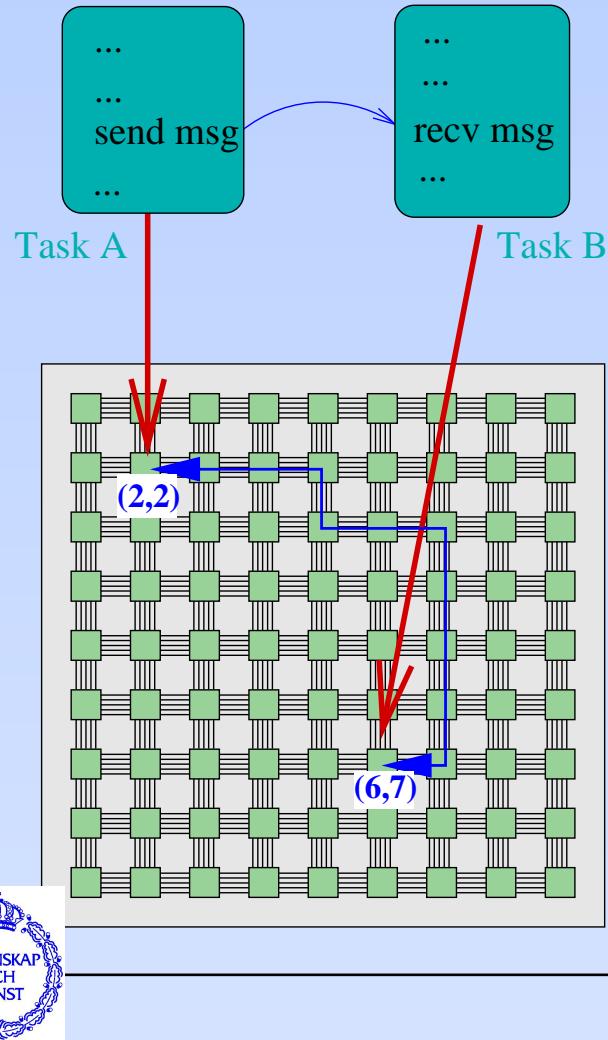

Nostrum status:

- Link layer packet = network layer packet
- Relative x-y addresses
- Deflective routing with no buffers and no routing tables
- Virtual circuits with guaranteed bandwidth and delays
- No error protection

# Session Layer

## Parameters:

- Task level communication primitives
- Message passing
- Shared memory based communication
- Synchronization
- Error correction

## Nostrum status:

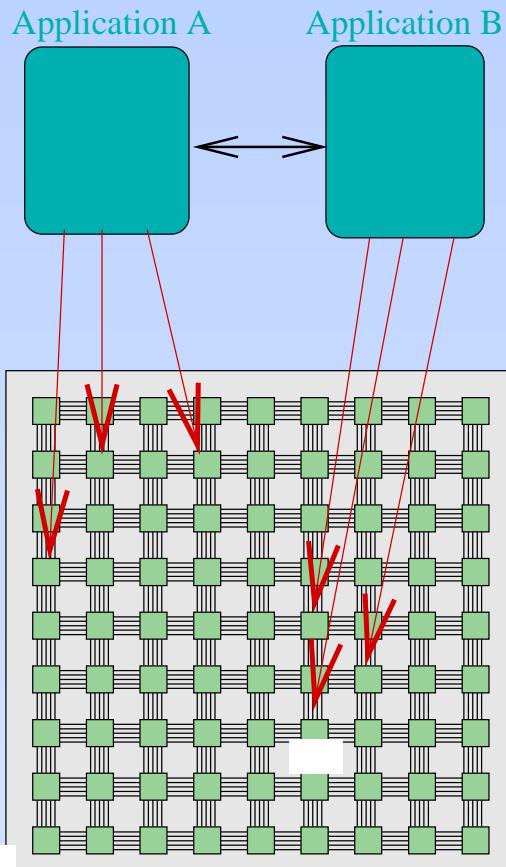

- Set of communication primitives defined
- Both message passing and shared memory
- User controlled synchronization
- Optional end-to-end data protection

## Session Layer Communication

- Message passing communication:
  - ★ open/listen/accept/bind primitives to open a channel
  - ★ send/receive to communicate
  - ★ close to tear down the channel
  - ★ blocking/non-blocking send/receive
- Shared memory communication:
  - ★ allocation
  - ★ read/write
  - ★ free
  - ★ interruptible/non-interruptible
- VHDL,C and SystemC libraries under development

# Application Layers

Application specific communication services;  
E.g. the NoC operating system could use:

- Task/resource database access protocol
- Task migration protocol

# Overview

Introduction

Protocol Stack

**The Network Layer and the Switch**

Data Protection

Clocking

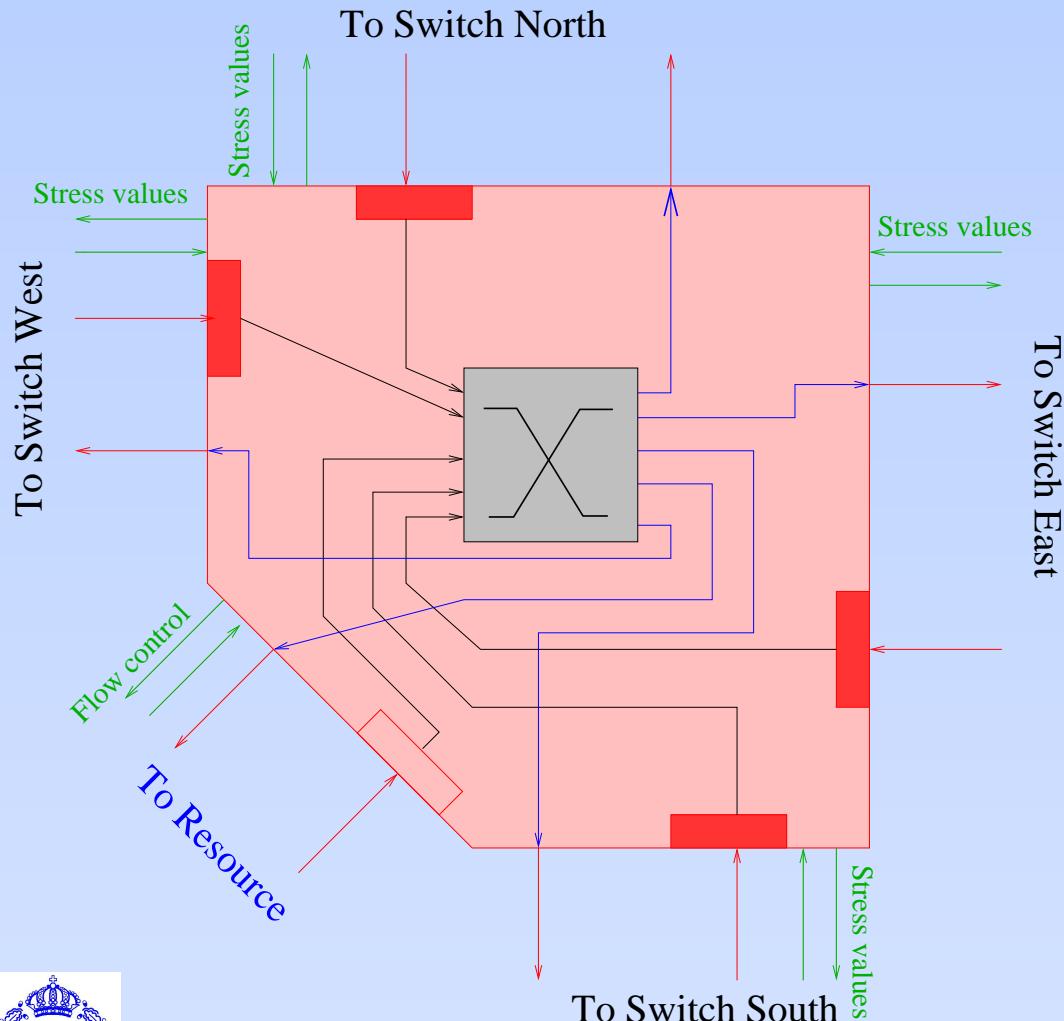

# The Network Layer

- Packet switched best effort service
  - ★ Packets are guaranteed to arrive
  - ★ Packet payload may be protected (4 levels of protection)
  - ★ Load dependable delay in the network
  - ★ Load dependable delay at the network access point
- Virtual circuit service
  - ★ Guaranteed bandwidth
  - ★ Guaranteed maximum delay
  - ★ Multicast circuits
  - ★ Based on packet switching service

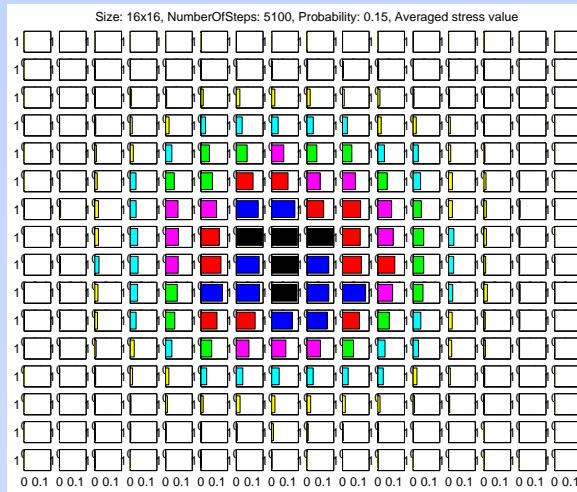

# The Bufferless Switch

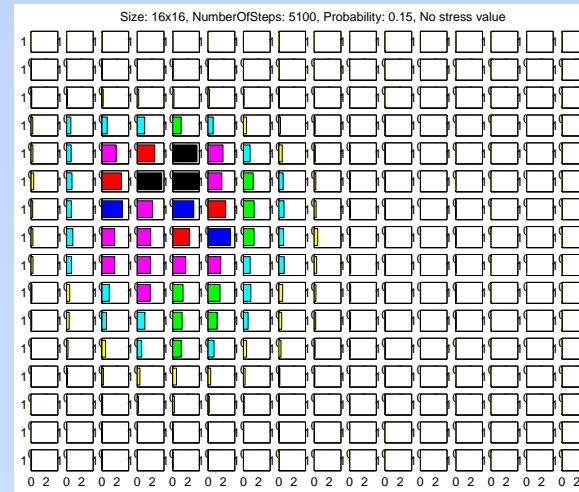

- + No buffers
- + No routing table
- + Small area
- + Short delay
- + Low power consumption
- Non-shortest path
- Header overhead due to destination address

# Stress Value Effect on Buffer Sizes and Delays

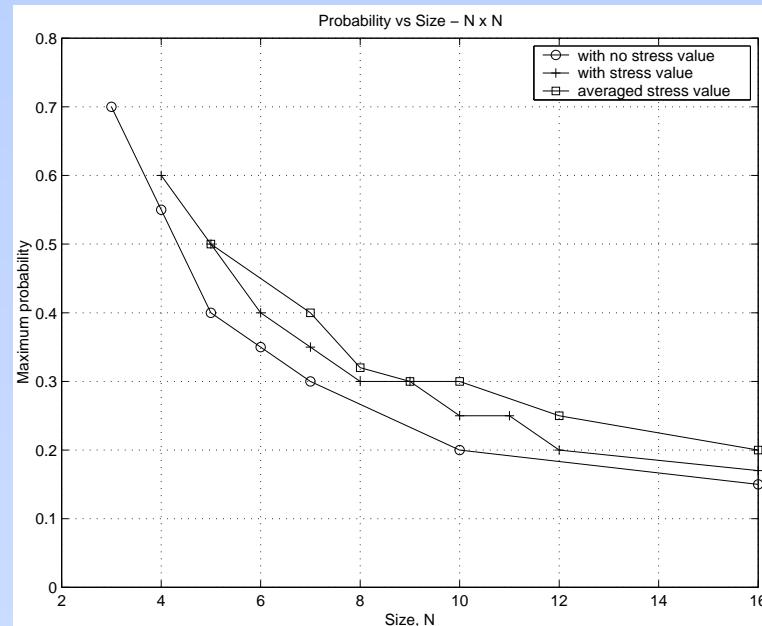

Largest average buffer size: 3.2

Largest average buffer size: 0.1

# Stress Value Effect on Maximum Load

## Looped Container based Virtual Circuit

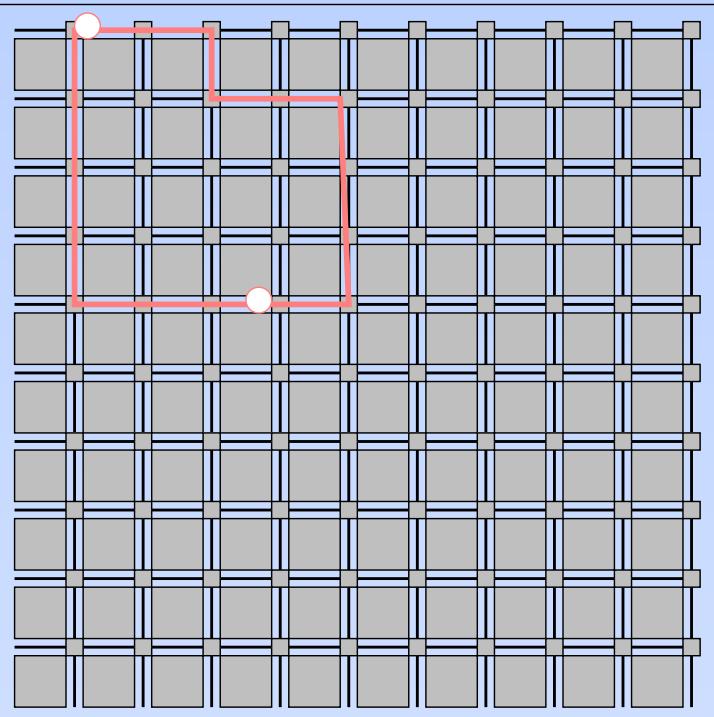

- A container packet loops between two or more end points
- The looping container establish a closed virtual circuit
- The virtual circuit allows multicast and bus protocol emulation
- Possible bandwidth allocation:

$$2^{j-d}B$$

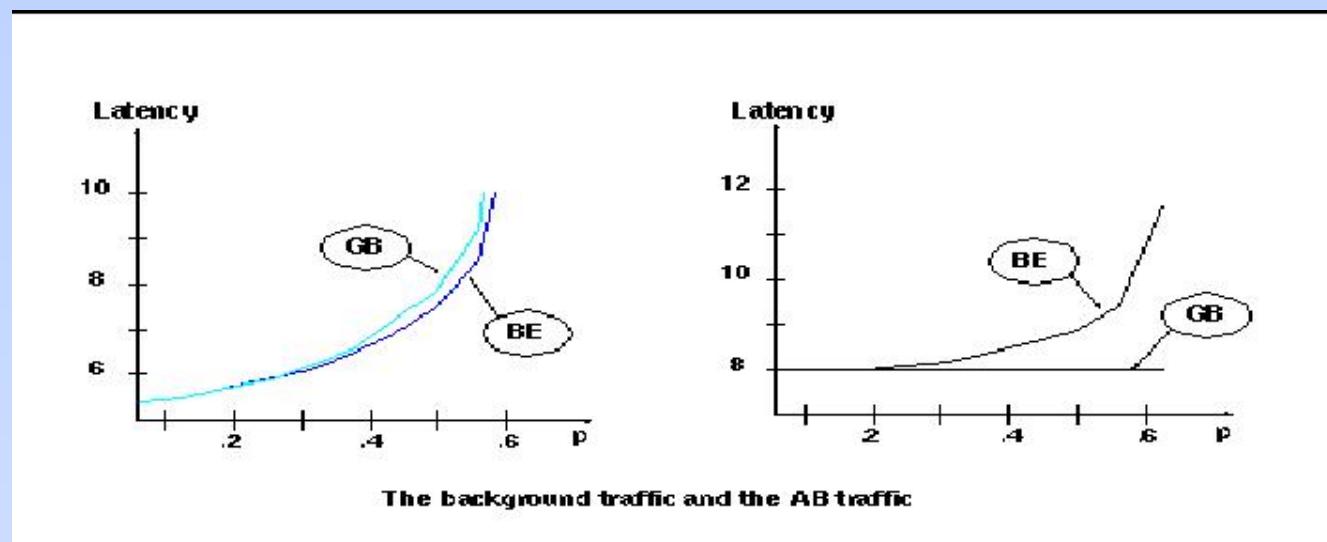

where  $B$  = link bandwidth,  $d$  = length of the container loop,  $1 \leq j \leq d$

- Examples:
  - $d = 2$ : possible allocations: 100% and 50%
  - $d = 4$ : possible allocations: 100%, 50%, 25%,

.5%

**Data Protection**

Clocking

# Data Protection

- Two level protection: Link layer and session layer
- Data link layer protection:
  - ★ SEC-DED header protection (16/26 bits)
  - ★ Four levels of payload protection:
    - \* Maximum bandwidth - no protection (102/102 bits)
    - \* Guaranteed integrity - DED protection (90/102 bits)
    - \* Minimum latency - SEC protection (90/102 bits)
    - \* High reliability - SEC-DED protection (81/102 bits)
- Session layer:
  - ★ Normal mode: Send-and-Forget (SaF) service
  - ★ Reliability mode: Acknowledgement-and-Retransmit (AaR) service
    - \* window size  $N$ ,  $1 \leq N \leq 64$
    - \*  $2N$  packets are buffered in sender and receiver
    - \* End-to-end flow control mechanism
- in total 8 modes available

Data Protection

**Clocking**

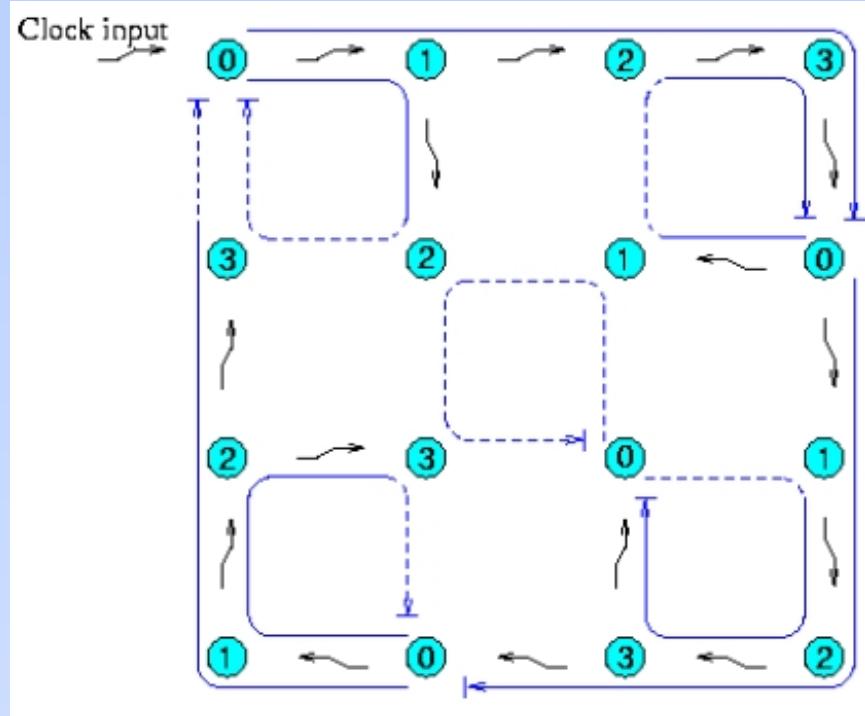

## Globally Pseudosynchronous - Locally Synchronous Clocking

- Latency reduce with 29% at low load; 40% at high load
- Can handle 10% higher load
- More skew tolerant
- Clock skew and jitter is depending only on local constraints
- No global clock distribution with associated power gains
- Reduced peak power with 50% at best
- Jitter reduced significantly

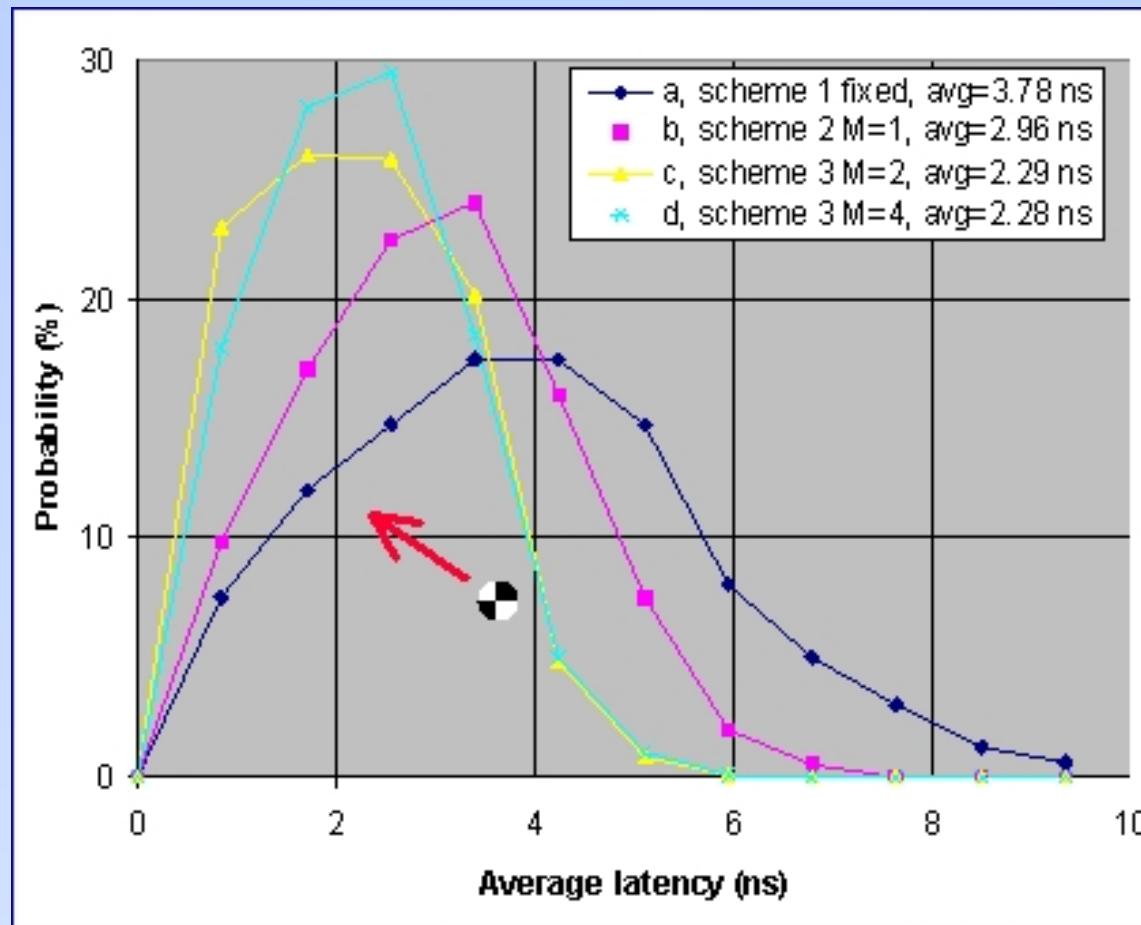

## Globally Pseudosynchronous Clocking - cont'd

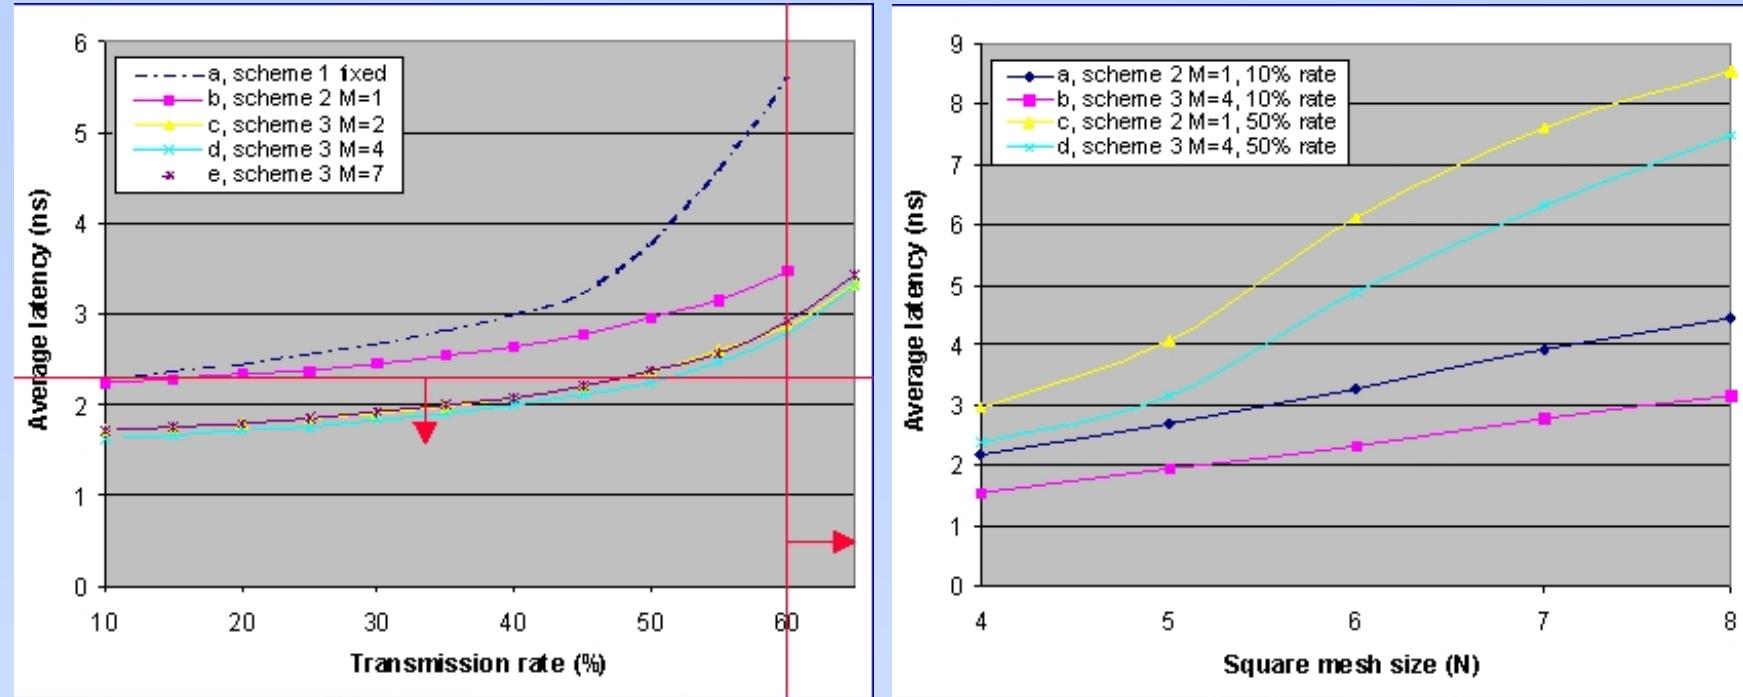

- Downstream data create low latency paths (Data Motorways)
  - ★ Guaranteed data motorways
  - ★ Phase related data motorways
- Periphery roundtrip:
  - ★ 14 cycles downstream
  - ★ 21 cycles upstream
  - ★ 24 cycles synchronous

## Globally Pseudosynchronous Clocking - cont'd

## Globally Pseudosynchronous Clocking - cont'd

## Summary of Nostrum Status

- Nostrum defines a 2 D mesh topology;
- Protocol stack for link layer, network layer and session layer;
- Packet switched and virtual circuit communication services;
- Buffer-less, loss-less switch with no routing tables;
- 2 level data protection scheme;
- Session layer communication primitives;
- Flexible NoC Simulator;

## Next Steps

- Application Specific Nostrum based Platforms (ASP)
  - ★ Network processor ASP
  - ★ Mobile device ASP
  - ★ Automotive ASP
  - ★ Prototyping ASP
  - ★ First pass radio ASP
- Develop application specific traffic patterns
- Dynamic virtual circuits
- Admission protocol
- Communication refinement
- Application mapping
- Application designers interface
